

# Tree Traversal

Section 10.3

# Tree Traversal

- Process of “walking” on an ordered rooted tree
  - In a systematic fashion
- Has several strategies

## Why ordered tree?

- We require that because we want to “uniquely” identify each vertex
- Ordered tree has its vertices aligned properly
  - i.e., we have clear idea on what is the arrangement of the children

## Universal Address System

- A way to uniquely identify vertices in a tree
- We label every vertex using the following rule
  - Label the root with the integer 0.
    - Then label its  $k$  children (at level 1) from left to right with  $1, 2, 3, \dots, k$
  - For each vertex  $v$  at level  $n$  with label  $A$ 
    - We label its  $k_v$  children as they are drawn from left to right as  $A.1, A.2, A.3, \dots, A.k_v$

40

## Back to traversal

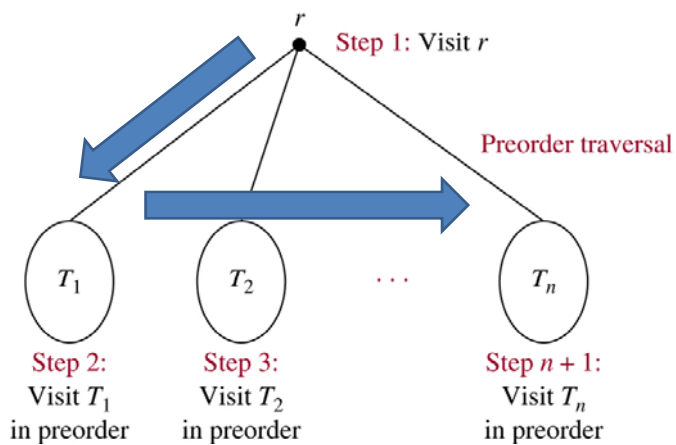

- We wish to **“list”** vertices in the tree
  - in some particular order
- Several strategies
  - Preorder
  - Inorder
  - postorder

## Preorder Traversal

- List the root
- then visit each subtree
  - Using the same method
    - (list root of the subtree then visit subtree of the subtree)
    - ...

# Preorder traversal

Preorder traversal: Visit root, visit subtrees left to right

prepared by Nattee Niparnan

# Step

prepared by Nattee Niparnan

## Step

prepared by Nattee Niparnan

47

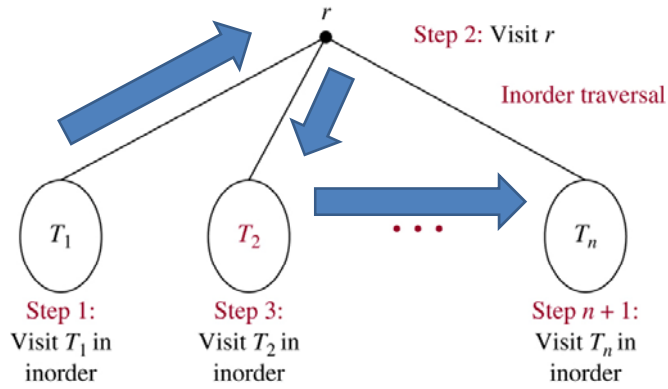

## Preorder Traversal

- Visit the left subtree
- Then list the root
- Then visit the rest subtrees

prepared by Nattee Niparnan

48

# Inorder Traversal

prepared by Nattee Niparnan

49

# Example

prepared by Nattee Niparnan

50

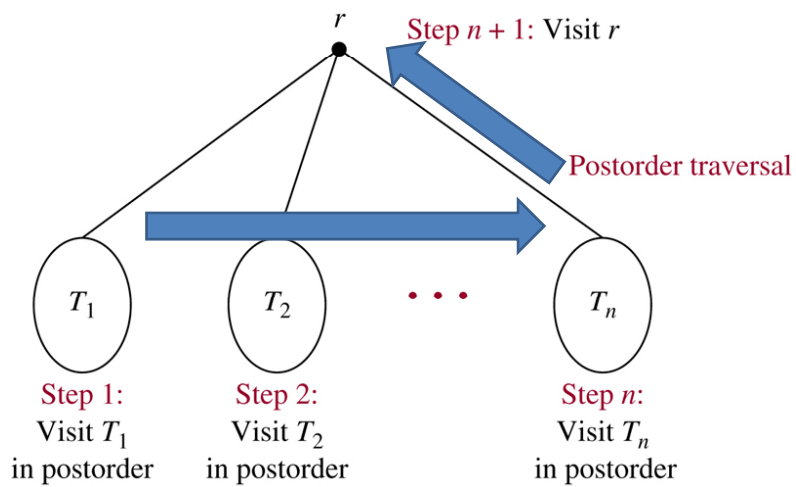

# Postorder Traversal

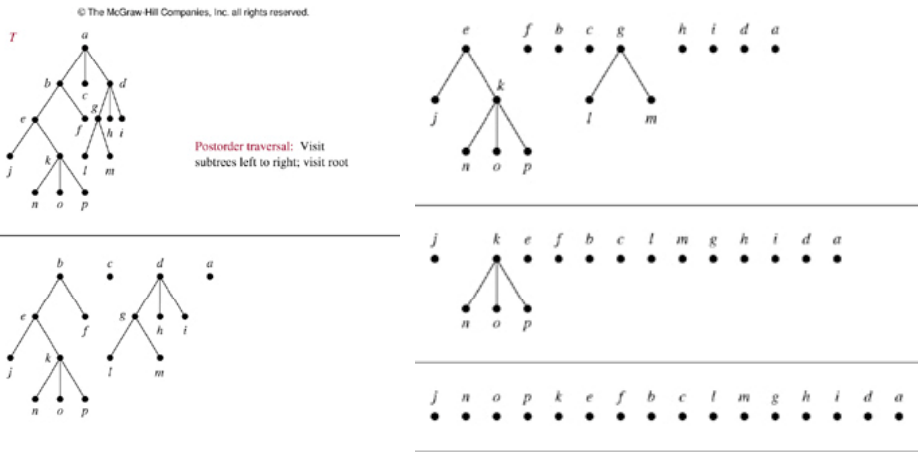

- Visit each subtree
- Then list the root

## Infix, Prefix and Postfix notation

- By traversing an expression tree using inorder, preorder or postorder
  - We get infix, prefix or postfix notation of the expression
- Infix : an operator is in the middle
- Prefix: an operator is at the front
- Postfix: an operator is at the back

## Example: Infix

## Prefix notation

- Operator is in front of the operands

$+ \uparrow + x y 2 / - x 4 3$

No parenthesis is needed!!!

## Postfix notation

- Operator is in front of the operands

$x y + 2 \uparrow x 4 - 3 / +$

No parenthesis is needed!!!

## Evaluating Prefix and Postfix

- Scan from left to right until we found something in this form
  - Let “a” be some operand
  - Let “\*” be some operators
- Prefix: \* a a
- Postfix: a a \*
- Convert that

prepared by Nattee Niparnan

59

## Evaluating Prefix and Postfix

© The McGraw-Hill Companies, Inc. all rights reserved.

+ - \* 2 3 5 / ↑ 2 3 4

2 ↑ 3 = 8

+ - \* 2 3 5 / 8 4

8 / 4 = 2

+ - \* 2 3 5 2

2 \* 3 = 6

+ - 6 5 2

6 - 5 = 1

+ 1 2

1 + 2 = 3

Value of expression: 3

© The McGraw-Hill Companies, Inc. all rights reserved.

7 2 3 \* - 4 ↑ 9 3 / +

2 \* 3 = 6

7 6 - 4 ↑ 9 3 / +

7 - 6 = 1

1 4 ↑ 9 3 / +

1<sup>4</sup> = 1

1 9 3 / +

9 / 3 = 3

1 3 +

1 + 3 = 4

Value of expression: 4

63

## Spanning Tree Definition

- Let  $G$  be a simple graph. A spanning tree of  $G$  is a subgraph of  $G$  that is a tree containing every vertex of  $G$

prepared by Nattee Niparnan

64

## Example

A simple graph  $G$

Spanning Tree of  $G$

prepared by Nattee Niparnan

65

## Constructing Spanning Tree

- By removing edges that form simple circuit

Edge removed:  $\{a, e\}$

(a)

$\{e, f\}$

(b)

$\{c, g\}$

(c)

prepared by Nattee Niparnan

66

## Theorem 1

- A simple graph is connected if and only if it contains spanning tree
